

1. User Story - Tests Generator

- Add a button option to generate a feature file for user stories.
- The frontend should include a “Generate Feature File” button.
- The backend should use the corresponding system prompt.
- Display the generated feature file in the UI.

2. User Story Tests Generator - Jira Integration

- Implement Jira integration using vibe coding to fetch user stories in both frontend and backend.
- Integrate with Jira to fetch stories.
- Introduce a “Fetch User Stories” button to retrieve stories.

Generate comprehensive test cases from your user stories

Story Title *

User Story: HC-311 — Automated Insurance Pre-Authorization for Radiology Tests

Description

Description:
Before scheduling any CT, MRI, or ultrasound procedure, the system should trigger an API call to the insurance provider to check if the procedure is covered under the patient's plan. If authorization is required, it should initiate the pre-authorization process automatically and store the approval ID in the patient record.

Acceptance Criteria *

When the request is sent,
Then the system should store the authorization ID and approval date in the billing record.

Given a test is not covered,
When the result is received,
Then the system should notify both the coordinator and patient, and offer alternative payment options.

Generated Feature File

Feature file generated

```
Feature: Automated Insurance Pre-Authorization for Radiology Tests

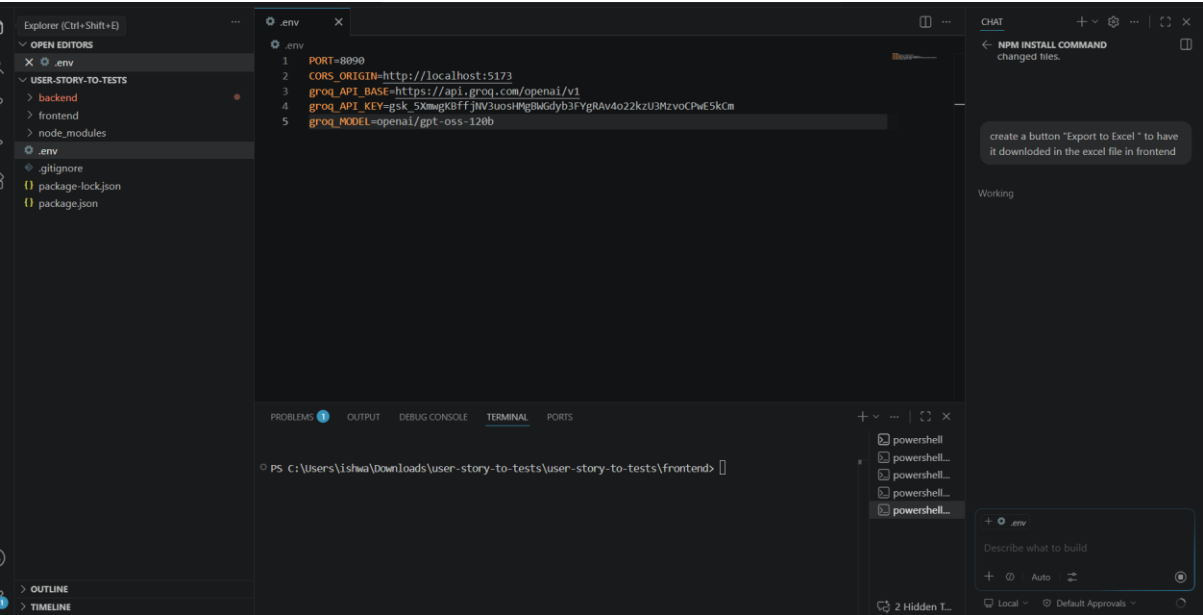

Background:
  Given a patient is scheduled for a radiology test

Scenario: Verify insurance eligibility when scheduling a radiology test
  When the billing coordinator selects "Schedule Test"
  Then the system verifies insurance eligibility via the insurance API

Scenario: Store pre-authorization details when required
  Given the test requires pre-authorization
  When the pre-authorization request is sent
  Then the system stores the authorization ID and approval date in the billing record

Scenario: Notify when test is not covered
  Given a test is not covered by insurance
  When the coverage result is received
  Then the system notifies the billing coordinator and the patient
  And the system offers alternative payment options

Scenario: Handle insurance API failure gracefully
  Given a patient is scheduled for a radiology test
  When the billing coordinator selects "Schedule Test"
```

Generated Test Cases			
12 test case(s) generated • Model: openai/gpt-oss-120b • Tokens: 2256			
Export to Excel			
Test Case ID	Title	Category	Expected Result
TC-001	Verify successful insurance eligibility check and test scheduling	Positive	System calls insurance eligibility API, receives covered response, and schedules the test without errors
TC-002	Pre-authorization required and stored correctly	Positive	System sends pre-authorization request, receives Authorization ID and approval date, and stores both in the billing record
TC-003	Notify coordinator and patient when test is not covered	Positive	System receives not-covered response, sends notification email/SMS to coordinator and patient, and displays alternative payment options
TC-004	Handle insurance API timeout gracefully	Negative	System shows a timeout error message, does not schedule the test, and logs the failure for retry

2. User story tests generator – with Vibe coding implement the Jira integration to fetch the user stories(both front end and backend)

Integration with JIRA to fetch the stories

Given a doctor with access to a patient record,
When they open the prescription module,
Then all pending prescriptions should be displayed for verification.

SCRUM-5

As a doctor, I want an automated prescription verification system so that I can review, approve, or modify prescriptions digitally before they are sent to the pharmacy.

Description: The issue involves creating an automated prescription verification system. This system will help doctors view medication details prescribed by other physicians or generated from patient diagnoses. N/A

Acceptance Criteria: See description for details
